                                                                                                                                                                                                                                                                                                                                                                                        properties and impart gloss to the paper during coating step. The present sequence represents a GTFB mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the GTFB sequence appearing as AAU98027 and the information in claim 36.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (NICH/) NICHOLS S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by Streptococcus mutans, particularly mouse-hybridoma MHP136 (FERM P-17567), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl transferase-B and is used in the immunotherapy of dental caries. This sequence represents a Streptococcus mutans monoclonal antibody-related
                                                                                                                                                Glucosyltransferase; coating composition; amyloplast; vacuole;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anti-caries agent composed of a monoclonal antibody against inhibitory enzyme against water insoluble glucan synthetase transferase-B (GTF-B) of Streptococcus mutans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               04-OCT-2000; 2000JP-0304889.

                                                                                                                                                                                                                              Ś
                                                                                                                                                                                                                                                                                                                                                                                                  thermoplastic molecule or their combinations or glucan and starch where the glucan is produced in the amyloplast and/or vacuole or a maize line deficient in starch biosynthesis, transformed with a gene encoding a CC glucosyltransferase B or D enzyme, wild-type or mutant and a paper CC comprising the glucan (paper sizing/coating agent). The vector is useful CC for producing a glucan in a plant. The method comprises transforming a CC plant cell with the vector, growing the plant cell under plant growing CC conditions to produce a regenerated plant and inducing expression of the CC regenerated plant, where the vector contains a transit sequence from CC ribulose biphosphate carboxylase small subunit, waxy, brittle-1 and CC chlorophyll AB binding protein to produce a transgenic plant, and glucan is produced in the amyloplast of potato or the vacuole of sugar beet. CC Glucans are useful as substitutes for and additions to modified starch CC and latexes in paper manufacture. Unlike prior art techniques, which CC require input materials that produce chemical effluents, paper manufacture utilising the glucan produced by GTF, which utilises to loologically produced input materials, is more cost-effective and CC environmentally friendly. Moreover, glucans also exhibit thermoplastic CC The present sequence represents GTFC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention an isolated protein comprising a glucosyltransferase (GTF) B polypeptide having changes at position from 1448V, D457N, D567T, M1014T, D457N/D567T, D457N/D571K, D567T/D571K, CD567T/D571K, K1014T, D457N/D567T, D457N/D57K, D567T/D571K, K1014T, T448V/D457N/D567T/D571K/K779Q/K1014T, CV169A/Y170A/Y171A, and K779Q or a GTF D polypeptide having changes at positions from T589D, T589E, N471D, T589D, and CC (hanges at positions from T589D, T589E, N471D, T589D, and CC (hanges at positions from T589D, T589E, N471D, T589D, and CC (hanges at positioned which encodes P1 or P2, or its complementary CC an isolated polynucleotide which encodes P1 or P2, or its complementary CC an expression cassette comprising the polynucleotide operably linked to a promoter, a vector comprising the polynucleotide operably linked to a promoter, a vector comprising the expression cassette, host cell introduced with the vector, a transgenic plant comprising the vector coating composition comprising a glucan produced in a plant transformed with a gene encoding the mutant GTF, wild type or, starch, a latex, where

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by Streptococcus mutans, particularly mouse-hybridoma MHP126 (FERM P-17566) or mouse-hybridoma MHP136 (FERM P-17567), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl transferase-B and is used in the immunotherapy of dental caries. This

The vector is useful GC for producing a glucan in a plant. The method comprises transforming a GC plant cell with the vector, growing the plant and inducing expression of the CC polynucleotide for a time sufficient to produce the glucan in the GC ribulose biphosphate carboxylase small subunit, waxy, brittle-I and GC ribulose biphosphate carboxylase small subunit, waxy, brittle-I and GC chlorophyll Ab binding protein to produce a transgenic plant, and glucan is produced in the amyloplast of potato or the vacuole of sugar beet. GC and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produce chemical effluents, paper GC biologically produced input materials, is more cost-effective and CC environmentally friendly. Moreover, glucans also exhibit thermoplastic GC The present sequence represents a GTFB mutant of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 13

CC MATLD/TSSPE. Also included are a glucan produced by the GTF mutant, CC MATLD/TSSPE. Also included are a glucan produced by the GTF mutant, CC polynucleotide, a ribonucleic acid sequence encoding the GTF mutant, CC an expression cassette comprising the polynucleotide operably linked to a CC promoter, a vector comprising the expression cassette, host cell coating composition comprising a glucan produced in a plant transformed CC with a gene encoding the mutant GTF, wild type or, starch, a latex, CC thermoplastic molecule or their combinations or glucan and starch where CC deficient in starch biosynthesis, transformed with a gene encoding the mutant GTF, wild type or, starch, a latex, CC comprising a glucan produced in a plant transformed CC deficient in starch biosynthesis, transformed with a gene encoding a CC glucosyltransferase B or D enzyme, wild-type or mutant and a paper CC comprising the glucan (paper sizing/coating agent). The vector is useful CC glucan is produce a regenerated plant and inducing expression of the CC polynucleotide for a time sufficient to produce the glucan in the cC glucan in a plant. The method comprises transforming a cc polynucleotide for a time sufficient to produce the glucan in the CC glucan see biphosphate carboxylass small subunit, waxy, brittle-1 and CC is properties in the amyloplast of potato or the vacuole of sugar beet. CC glucans are useful as substitutes for and additions to modified starch cC manufacture utilising the glucan produced by GTF, which utilises beet. CC glucan produced by GTF, which utilises which cc mylorementally friendly. Moreover, glucans also exhibit thermoplastic CC moter The present sequence represents a GTFB mutant of the invention.

CC Moter The present sequence is not shown in the specification but in the information in claim 36.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11-DEC-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the glucan is produced in the amyloplast and/or vacuole or a maize line conficient in starch biosynthesis, transformed with a gene encoding a glucosyltransferase B or D enzyme, wild-type or mutant and a paper comprising the glucan (paper sizing/coating agent). The vector is useful comprising the glucan in a plant. The method comprises transforming a glutant roll with the vector growing the plant cell under plant growing conditions to produce a regenerated plant and inducing expression of the glynucleotide for a time sufficient to produce the glucan in the creptor contains a transit sequence from cribilose biphosphate carboxylase small subunit, waxy, brittle-1 and chilose biphosphate carboxylase small subunit, waxy, brittle-1 and chilose biphosphate carboxylase small subunit, waxy, brittle-1 and contingually and produced in the amyloplast of potato or the vacuole of sugar bett.

CC glucans are useful as substitutes for and additions to modified starch crequire input materials that produce chemical effluents, which crequire input materials that produced by GTF, which utilises biologically produced input materials, is more cost-effective and convironmentally friendly. Moreover, glucans also exhibit thempolastic properties and impart gloss to the paper during coating step. The present sequence represents a GTFB mutant of the invention but come of the invention in claim 36.

II FUNCTION: PRODUCTION OF EXTRACELULAR GLUCANS, THAT ARE THOUGHT TO PLAY A KEY ROLE IN THE DEVELOPMENT OF THE DENTAL PLAQUE BECAU OF THEIR ABILLTY TO ADHERE TO SMOOTH SURFACES AND MEDIATE THE AGREGATION OF BACTERIAL CELLS AND FOOD DEBRIS.

I CATALYTIC ACTIVITY: Sucrose + {(1,6)-alpha-D-glucosyl}(N) = D-fructose + {(1,6)-alpha-D-glucosyl}(N+1).

I CHICAGE + (1,6)-alpha-D-glucosyl}(N+1).

I SUBCELLULAR LOCATION: Secreted.

I J-LINKED GLUCANS AND SOME 1,6 LINKAGES), GTF-S SYNTHESIZES BOTAL TEACH OF CHURCANS (ALPHA 1,6-GLUCOSE). GTF-SI SYNTHESIZES BOTAL GREEN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  OF THEIR ABILITY TO ADHERE TO SMOOTH SURFACES AND MEDIATE THE AGGREGATION OF BACTERIAL CELLS AND FOOD DEBRIS.

CATALYTIC ACTIVITY: Sucrose + {(1,6)-alpha-D-glucosyl}(N) = Efructose + {(1,6)-alpha-D-glucosyl}(N+1).

SUBCELLULAR LOCATION: Secreted.

DISBASE: DENTAL CARIES.

MISCELLANBOUS: GTF-I SYNTHESIZES WATER-INSOLUBLE GLUCANS (ALE MISCELLANBOUS: GTF-I SYNTHESIZES WATER-SCLUBLE GLUCANS (ALPHA 1,6-GLUCOSE). GTF-SI SYNTHESIZES WATER-SCLUBLE GLUCANS (ALPHA 1,6-GLUCOSE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FORMS OF GLUCANS.
SIMILARITY: TO OTHER GLUCOSYLTRANSFERASES
BINDING PROTEIN FROM S.MUTANS.
SIMILARITY: Contains 6 cell wall binding 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 s requires a license agreement (Some an email to license@isb-sib.ch).

FUNCTION: Required for the development of competence in FUNCTION: Required for the expression of late-expressing competence genes, and for the expression of the growth stage-regulated molecule surfactin. May play a regulatory role during the development of competence, and an analogous role as urrC-ORF development of competence, and an analogous role as urrC-ORF

                                                                                                                                                                                                                            similarity).

CATALYTIC ACTIVITY: Exonucleolytic cleavage in the direction to yield nucleoside 5'-phosphates.

SUBCELLULAR LOCATION: Cytoplasmic (By similarity): SIMILARITY: Belongs to the ribonuclease II (RNB)

SIMILARITY: Contains 1 SI motif domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=22272406; PibMed=12384590;
